          colony-stimulating factor (GMCSF), and nuclectides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences 25552-25560 and 255561-25566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine and 78 respectively. The invention relates to canine or feline CDL9 (CD40 ligand), canine IL-13, feline CDL94 (CD40 ligand), canine IL-13, feline colony-stimulating factor (GMCSF), and nucleotides which encode these colony-stimulating factor (GMCSF), and nucleotides which encode these inmunoregulatory proteins. The proteins which encode these nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

the response from a co-administered antiqen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase
                                                                                                                                                                                                                                                                                                                                                                                                               Sequences 25552-25550 and 25551-25566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine IL-14, canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nuclectides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids; specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                caacctgaccgccggcatgtactgcgcagctctagaatctctgatcaatgtctccgactg 180

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -

Disclosure; Page 1336; 1592pp; English.

The antitional series of the control oligonucleotides and compositions (1) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (1) can have respiratory, bronchodilator, antilflammatory, analogsic, immunosuppressive, antiathmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (1) can be used to down-regulate the pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. F18434 to F21543 represent human polynucleotide fragments present invention describes low adenosine (A) content antisense and antisense oligonucleotides used in the exemplification of the present invention. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                           272

//dev_stage="seedling three-leaf stage"
//doctor: Bluescript Sk+/Xhnl-EccRI; Site_1: Ecc RI;
//doctor: Nho I: Sampled three-leaf seedlings treated for
one week at 2cc, 12 hrs light/day. Library made with
Stratagene UNIZAP XK Kit/(not packaged). cDNA is directly
ligated into Sk+/Xhol-EccRI, then electroporated into
TOPIO cells (Invitrogen).

ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested and cloned into distinct DraIII sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site CACATGTG). XhoI should be used to isolate the CDNA insert. Size selection was performed to exclude fragments 41.5kb. Library constructed by Dr. Sumio Sugano (University of Tokyo Institute of Medical Science). Custom primers for sequenching: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end primer CGACCTGCAGCTGCAG." 8 others

sequences encoding canine interletekin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
CC IL-4, canine or felline Pit-3 ligand, canine or felline CD40, canine or felline CD40, canine it-5, canine IL-13, felline
CC IL-4, canine or felline Pit-3 ligand, canine or felline CD40, canine or
felline CD154 (CD40 ligand), canine IL-5, canine IL-13, felline
colony-stimulating factor (GMCSF), and nucleotides which encode these
colony-stimulating factor (GMCSF), and nucleotides which encode these
Immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
conclete acids, specific antibodies and inhibitors may be used as
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antiquen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
an also be used to raise antibodies and to screen for

sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or felline Fit-3 ligand, canine or felline CD40, canine or
felline CD154 (CD40 ligand), canine IL-5, canine IL-13, felline
interferon-alpha (IFN-alpha) and felline granulocyte macrophage
colony stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as sources of inhibitory therapeutics (e.g., antisense oligonuclectides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          agocotgigacicocicocoascoticaaggagoticatigaggagotiggicaacaticace 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or felline Flt-3 ligand, canine or felline CD46, canine or felline Flt-3 ligand, canine IL-5, canine IL-13, felline
IL-4, canine Or felline Flt-3 ligand, canine or felline CD40, canine or felline CD54 (CD40 ligand), canine IL-5, canine IL-13, felline
Interferon-alpha (IEN-alpha) and felline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins any be used as
colony-stimulating factor (GMCSF), and inhibitors may be used as
nucleic acids, specific antibodies and inhibitors may be used as
conceptors for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense alloquucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Z55552-Z55560 and Z55561-Z55566 represent cDNA

Sequences 25552-255560 and 255561-255566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine CD14, canine or feline Filt-3 ligand, canine or feline CD40, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony stimulating factor (SMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection. Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease immunoregulation; tumour; cancer; autoimmune disease; vaccine; antibody; canine; inhibitor; immune Canine interleukin-13 (IL-13) clone 80 cDNA coding region. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequences encoding canne interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canne IL-4, canine or feline Fil-3 ligand, canine or feline CD134 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IRW-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophlactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including
Canine interleukin-13 (IL-13) clone 80 cDNA coding region complement.
                                                                                                                                                                                                                                                                                                                                            Interleukin-13; IL-13; antibody; canine; inhibitor; immune response; immunoregulation; tumour; cancer; autoimmune disease; vaccine; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences Z5552-Z55560 and Z55561-Z55566 represent cDNA

sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine IL-4, canine or feline Fit-3 ligand, canine confeline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease

the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

They may be used to treat attoring or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1153 AGCCCTGTGACTCCCTCCCCAACCTCAAGGAGCTCATTGAGGAGCTGGTCAACATCACC 1094

                                                     Sequences 25552-25560 and 25551-25566 represent cDNA and 78 respectively. The invention relates to canine 1L-4, canine or feline Flt-3 ligand, canine or feline Flt-3 ligand, canine or feline CD40, canininterferor-alpa (FN-alpha) and feline granulocyte macrophage interferor-alpa (FN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode timmunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (Particularly cats, dogs, horses and humans).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 atggcgctctggttgactgtggtcattgctctcacctgcctcggtggccttgcctcccg

Key

Canis familiaris.

Canine interleukin-13 (IL-13) clone 80 cDNA complement.

14-MAR-2000 (first entry)

```
sequences encoding canine interleuls (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or felline flt-3 ligand, canine or felline
IL-4, canine CD154 (CD40 ligand), canine IL-5, canine IL-13, felline
Interferon-alpha (IFN-alpha) and felline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
immunoregulatory proteins. The proteins, their associated
cuclet acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophlactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides)
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                               Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease
                                                                                                                                                                                                                                             Sequences Z5552-Z55560 and Z55561-Z55566 represent CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1302 BP; 337 A; 318 C; 340 G; 307 T; 0 other;

```
Sequences 25552-25560 and 255561-25556 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine of feline filt-3 ilgand, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon alpha (IRN alpha) and feline granulocyte macrophage interferon alpha (IRN alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies may be used in detection, modulators of activity, while the antibodies may be used in detection, and in drug targetting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences encoding canine interleuring the sequences encoding canine interleuring to canine and 78 respectively. The invention relates to canine

IL-4, canine or feline Fit-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ligand), canine IL-13, feline

interferon-alpha (IEN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nuclocides which encode these
immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
accines for therapeutic or prophylactic requiation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
alleries, tumours, inflammantion and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
se sources of inhibitory therapeutics (e.g., antisense aligonucleotides).
They proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,

Sequences 25552-25560 and 255561-25556 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine or feline Flt-3 ligand, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins: The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide fragments are useful as probes, as amplification primers and nucleotide fragments are useful as probes, as amplification primers and so success of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug targetting.
